

Project H. Hornet Steering Console

Sensor or Motor

This would provide the rotary force used to turn the front wheels and used to steer the model as it turns

Main steering arms

They will be jointed to the servo motor (blue) and the wheel axle (orange) and will serve the purpose of converting rotary motion to "linear" motion that will turn the wheels

Wheels of model

These will act as the main form of contact to the ground and would preferably be large enough to provide at least 2-3cm of clearance from the ground as model base tensioned

Solid center console

This will be the main rigid frame to which all the moving parts will be connected and it will be bolted down to the base of the vehicle

Suspension arms

These will be used to assist with the passive suspension of the model which will later either have spring or elastic band attach and also possibly host the self-wright passive mechanism as well
