

Robot H. Hornet Component Placement

Main Design Philosophy 3 Weight Distribution

"Mid to Rear Engine Inspired Design with the aim of either distributing weight equally across four wheel or be back heavy for better grip seeing as rear has main driving power."

Sensors Used

Combination of Ultrasonic sensor for obstacle avoidance the an infrared sensor for following marked and paths of travel

Microcontroller module

This will host the micro-controller we are provided with along with any other components such as the motor driving module and other such power distribution components as will be possible independent of the system so we can change weight distribution

Battery on Rear Wheel motors

The battery capacity will depend completely on the power requirement of the whole system and both a series and parallel battery setup to increase both voltage for more rpm for motors and ampage for more torque
